DETAILED ACTION

Claim Objections

1. Claims 18-36 are objected to because of the following informalities and/or defects:

Claims 18 and 36 each recite the term of "a conductive layer formed on the source region, the gate conductive layer and the body contact region" but fail to clarify whether this conductive layer comprising a single continuous piece (which is not supported by the original disclosure) or multiple separated pieces.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 28-36, rejected under 35 U.S.C. 103(a) as being unpatentable over Tyson (US 5,317,181) in view of Cherne (US H1435; of record).

Tyson discloses a semiconductor device (see Figs. 1-3) having an SOI structure, comprising: an insulating layer (34; oxide); an insular silicon region (P-; inherently a single crystal layer) including an insular body region (18, P-), a channel (32); a gate oxide layer (34); a gate conductive layer (12); a heavily doped body contact region (22)

Art Unit: 2811

and/or 24), a source region (14; n+); a drain region (16; n+); a conductive layer (26; TiSi, a salicide), wherein the body contact region being in contact with and connected to the source region and the insular body region, and the heavily doped body contact region does not overlap with the gate.

Although Tyson does not expressly disclose that the gate conductive layer can also be covered by a salicide layer from the same conductive layer, one of ordinary skill in the art would be readily recognize that the gate conductive layer, the source region and the body contact region can all be desirably covered by a salicide layer comprising a same metal silicide layer during a same salicide process for reducing the interconnection resistance, as evidenced in Cherne (see the salicide layer (95) covering the gate conductive layer (21), the source region (16) and the body contact region (72, 74, and/or 76) in Figs. 9 and 10, with the source electrode connected to the source region (N+ SOURCE) through the salicide conductive layer (95)).

Therefore, it would have been obvious to one of ordinary skilled in the art at the time the invention was made to incorporate the salicide strutture of Cherne into the semiconductor device of Tyson, so that a MOSFET device reduced interconnection resistance would be obtained.

Regarding claim 36, the MOSFET Tyson can also be formed as a P-channel MOSFET (see col. 6, lines 48-49), which would be naturally have a P-type source region and an N-type channel region.

Art Unit: 2811

3. Claims 18-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tyson in view of Cherne, as applied to claims 28-36 above, and further in view of Bahraman (US 5,001,528).

The disclosures of Tyson and Cherne are discussed as applied to claims 28-36 above.

Although Tyson and Cherne do not expressly disclose that the geometry of the source structure can be symmetrical to that of the drain structure in the sense that they have a same width and a same length, one of ordinary skill in the art would readily recognize that such a symmetry can be readily and desirably formed for achieving maximum effective channel width with structure simplicity, as evidenced in Bahraman (see the substantially symmetrical source region (2a) and drain region (2b) in Figs. 1-3).

Therefore, it would have been obvious to one of ordinary skilled in the art at the time the invention was made to incorporate the symmetric source/drain structure of Bahraman into the semiconductor device collectively taught by Tyson and Cherne, so that a MOSFET device with maximum effective channel width and structure simplicity would be obtained.

Regarding claim 23, the extended gate electrode portion in Fig. 1 of Tyson can be regarded as the recited gate electrode. And, a drain electrode is also always naturally included in a MOSFET, as shown in Fig. 10 of Cherne).

Art Unit: 2811

Response to Arguments

4. Applicant's arguments with respect to claims 18-36 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shouxiang Hu whose telephone number is (703) 306-5729. The examiner can normally be reached on Monday through Thursday, 7:30 AM to 6:00 PM.
